

# RCM Replacement After SRS Deployment

## RCM Replacement After SRS Deployment

**12-MAY-2023**

This document provides important information about the Restraint Control Module (RCM) in Lucid Air vehicles. The RCM is a crucial component of the vehicle's safety restraint system and is responsible for detecting and analyzing signals from various sensors and deploying the appropriate airbags and seatbelt pretensioners in the event of a crash.

The RCM is tied to several other components, including the:

- Airbags
- Airbag sensors
- Seatbelt pretensioners
- Occupant Classification System (OCS)

All these components work together to ensure the safety of the vehicle occupants during a crash.

The RCM must be replaced every time an SRS device is deployed.

Lucid Air has an extensive design, development, and testing program to ensure the safety systems in each model meet or exceed all Federal Motor Vehicle Safety Standards, as well as Lucid Air's own superior performance standards. Only Lucid Air safety system parts can be used in the repair of Lucid vehicles.

The use of non-Lucid Air parts, such as aftermarket or remanufactured parts, can compromise the function of the vehicle restraint system and the safety of the vehicle occupants.
